how many petabytes of data does google have

All News Images Shopping Videos More Tools

About 971,000 results (0.49 seconds)

1,200 petabytes

Science Focus estimates that Google, Amazon, Microsoft and Facebook collectively store **at least 1,200 petabytes**. (That's not even including well-known storage sites like Dropbox.) A thousand gigabytes equals a terabyte - or 1 million megabytes. Jul 29, 2019

Abstract

MapReduce is a programming model and an associated implementation for processing and generating large data sets. Users specify a *map* function that processes a key/value pair to generate a set of intermediate key/value pairs, and a *reduce* function that merges all intermediate values associated with the same intermediate key. Many real world tasks are expressible in this model, as shown in the paper.

Programs written in this functional style are automati-

given day, etc. Most such computations are conceptually straightforward. However, the input data is usually large and the computations have to be distributed across hundreds or thousands of machines in order to finish in a reasonable amount of time. The issues of how to parallelize the computation, distribute the data, and handle failures conspire to obscure the original simple computation with large amounts of complex code to deal with these issues.

As a reaction to this complexity, we designed a new
