explain super shortly Harbor Docker registry features

Harbor is an enterprise container registry built on top of the Docker Registry that adds **security, governance, and multi-registry management**.

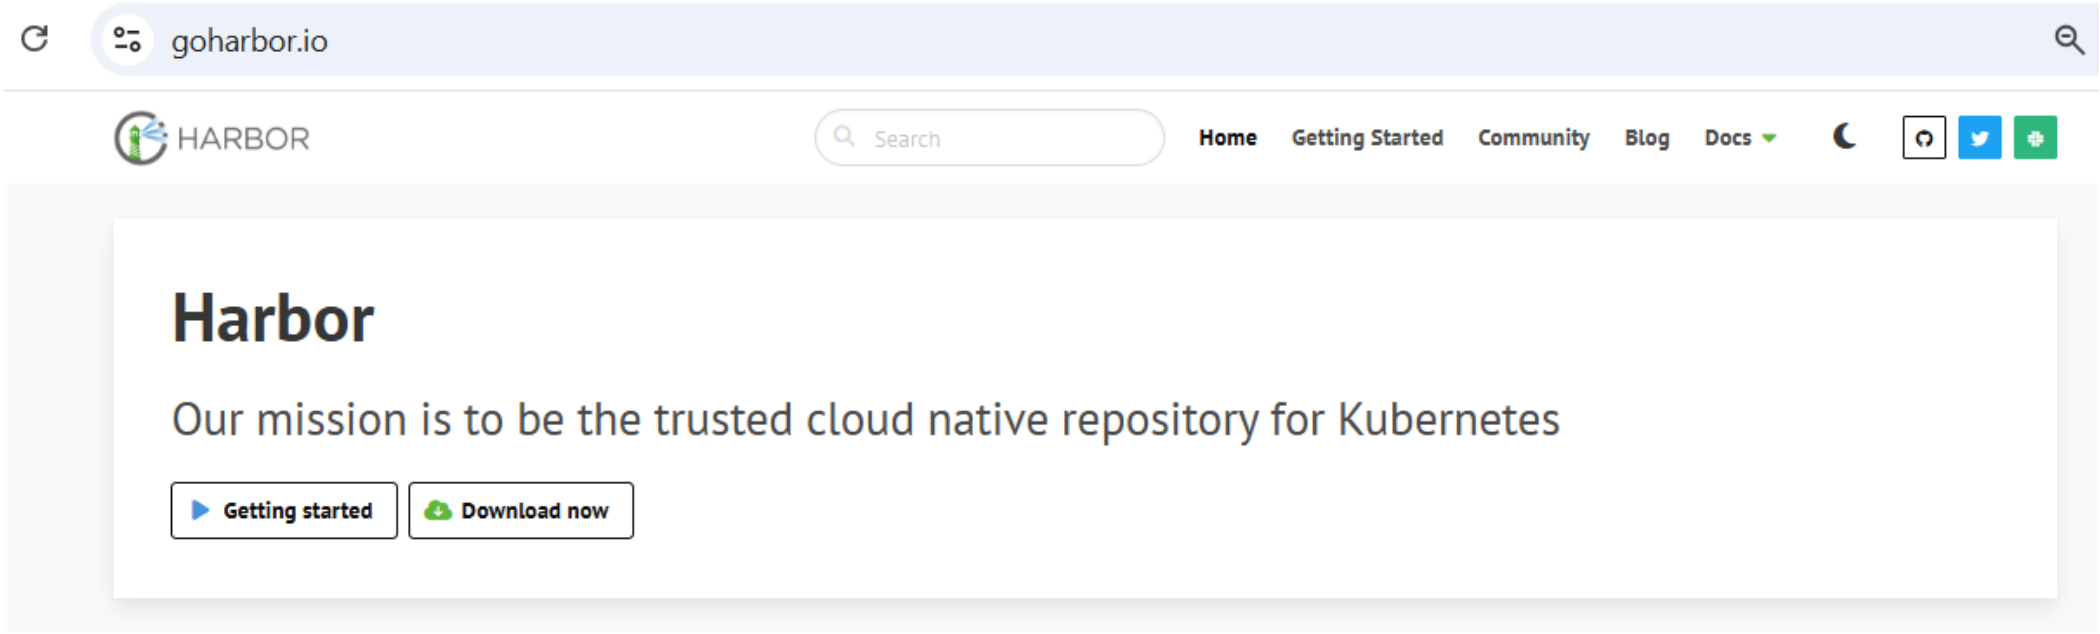

Main features (very short):

- **OCI artifact registry** – store container images, Helm charts, and other OCI artifacts.
- **Security scanning** – detect vulnerabilities using tools like Trivy.
- **Image signing & trust** – verify signed images with Cosign or Notary.
- **RBAC & projects** – multi-tenant access control and quotas.
- **Replication** – sync images across registries (e.g., Docker Hub or other Harbor instances).
- **Policies** – retention rules, immutable tags, security policies.
- **Web UI + API** – manage images, scans, and automation.

Summary: Harbor = **secure, enterprise-grade Docker/OCI registry with governance and replication.**
